During the review and validation process, some scoring errors were noted in a few entries. After manually re-scoring these logs, the claimed score was adjusted (some up and some down). In only one instance did the adjusted score result in a change of position and in that instance it was near the bottom of the list of stations in the Non-MDC Standard category. In this particular case it appeared that the logging software counted two contacts with stations in the same county as two separate multipliers rather than a single multiplier. We did note that in more than one instance, a particular logging software program calculated a final score that was usually 10 points higher than the actual score.
